

## TWIST/SPIN Parts & Pieces Working Instructions

**Join Coding** – Our interchangeable parts and pieces can be coded with an [M], [S] or [L] depending on the diameter of the join. Parts coded [S] are compatible with other [S] coded parts. Parts coded [L] are compatible with other [L] coded parts. Not all MINI diameter parts are coded [M] due to their small size.

**End Stoppers** – Black, white or red rectangular-shaped resin pieces screw into your cable ends to hold a current product while using the tips for another project. Each stopper has a hole in the metal piece. When tightening/loosening these, we recommend you use a tightening key to avoid separation. White = [S], Black = [L], Red = [M].

**Tightening Keys** – When screwing parts together, we recommend you use a tightening key (or two, depending on the size of the join and the product you have) to ensure a super tight join. For an even better connection, try using one of our heart-shaped rubber grippers or a gripper pad wrapped around your tip with a key. You will also need the key to loosen any connection. Available in S/L and MINI sizes.

**Tightening/Lifeline Holes** – The tightening holes at the ends of your cables double as lifeline holes. Thread yarn or embroidery floss into the hole at the end of your cable. While you knit a row this thread will knit in with your stitches providing a safety net in case you need to rip out rows – you now have a point to go back to.

**Cable Connectors** – Tiny “tic tac” sized pieces of metal that allow you to join two or more cables together to make a longer one. It is highly recommended to use the tightening keys when connecting cables together. Available in [S], [L] and MINI sizes.

**Adapters** – Tiny metal pieces that allow you to go from an [L] diameter tip to an [S] diameter cable OR from an [S] diameter tip to a MINI diameter cable. Available for separate purchase.

**All TWIST & SPIN parts and pieces are switchable.**
